

Lake Erie Hypoxia Forecast

2025-07-04

Summary

Localized hypoxic upwelling is possible along the Ohio coast from tomorrow (Friday) through Monday. A narrow band of hypoxic waters (<2 mg L⁻¹ dissolved oxygen) is located just offshore of the Ohio coast from Sandusky to east of Ashtabula. Southwesterly winds throughout the weekend may cause this water to move onshore, causing localized hypoxic events. The risk is highest from Sandusky to just west of Lorain and from Cleveland to Mentor, OH. This text will change if the risk changes. ##--Hounshell, Yu, 03 July 2025

Forecasted Temperatures and Oxygen Levels at Bottom

Sat 05 Jul 2025 11:00 EDT
2025-07-05 15 GMT

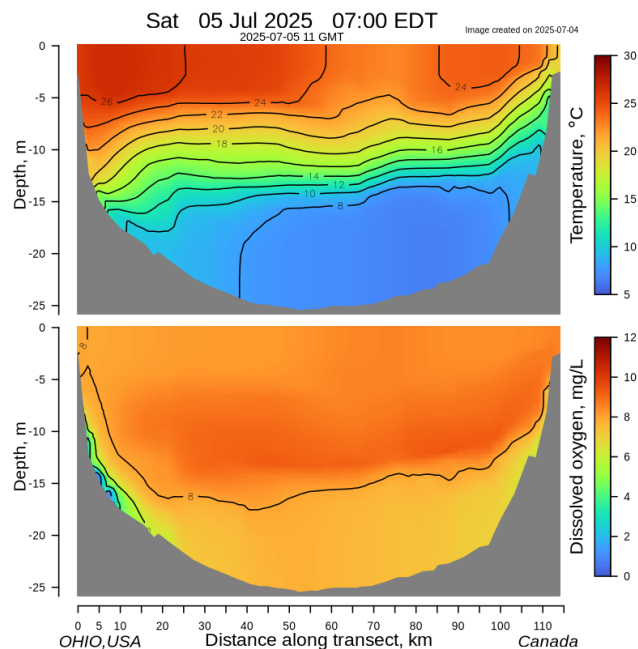

Model output includes near real-time estimated oxygen levels and temperatures in the bottom water across Lake Erie. In the top panel (temperatures), red colors indicate high temperatures (30 C) while blue colors indicate low temperatures (5 C). In the bottom panel (oxygen), red colors indicate high oxygen, while blue-green colors indicate hypoxic (< 2 mg/L) or anoxic (0 mg/L) conditions.

Vertical transect of Forecasted Oxygen and Temperature

This transect, marked as a light line on the map of Lake Erie, extends from just west of Cleveland, OH to west of Port Stanley, ON. In this cross-sectional view you can see today's modeled distribution of temperatures (top) and oxygen (bottom) in the water column in the center of the lake. The color scales are the same as in the whole-lake images.

Lake Erie Forecasted Winds Counts by Direction (Wind Rose Plot)

This panel depicts the frequency of occurrence of wind directions and speeds for yesterday, today, tomorrow, and the following 3 days. The length of each spoke indicates how frequently a wind blows from a particular direction. Wind speeds are indicated by color, as given by the color scale at the bottom of the plot. The data were sampled from the wind data used to drive the hydrodynamic model simulation at locations around the central basin of Lake Erie
