NCCOS NATIONAL CENTERS FOR COASTAL OCEAN SCIENCE

Lake Erie Harmful Algal Bloom Forecast

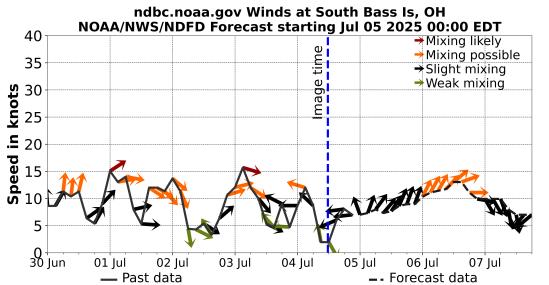

2025-07-04

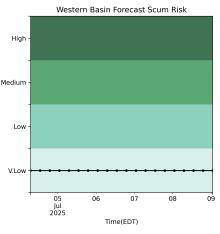

Summary

The cyanobacteria bloom in western Lake Erie has an approximate area of 10 square miles, which is unchanged from Jul 02. Satellite imagery is detecting patches of cyanobacteria (Microcystis) in North Maumee Bay near Erie, MI in far western Lake Erie. Sandusky Bay has a local bloom of mixed cyanobacteria. No toxins have been detected. --Hounshell, Yu 07/03/2025 The past few days of imagery can be seen at the HAB monitoring site. The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Last Updated: 2025-07-04 11 PM EST

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Jul 04, 2025, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows a truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

Wind speed and direction from SouthBassIs, OH. Blooms mix through water column at wind speeds > 15 knots.

Lake Erie Harmful Algal Bloom Forecast

Forecast surface bloom position for Jul 05, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Jul 09. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
