

Lake Erie Harmful Algal Bloom Forecast

NATIONAL CENTERS FOR COASTAL OCEAN SCIENCE

Imagery Analysis & Forecast - 2023-07-17

The *Microcystis* cyanobacteria bloom in western Lake Erie has an approximate area of 120 square miles, which is unchanged from Jul 10. Bloom extends from south of Monroe to Maumee Bay. Scum is likely nearshore during light wind, particularly in and east of Maumee Bay. High-level clouds and smoke over the weekend have prevented an assessment of current bloom status. No toxin data currently available. --S. Tomlinson 07/17/2023

The past few days of imagery can be seen at [the HAB monitoring site](#). The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Last Updated: 2023-07-17 10 AM EST

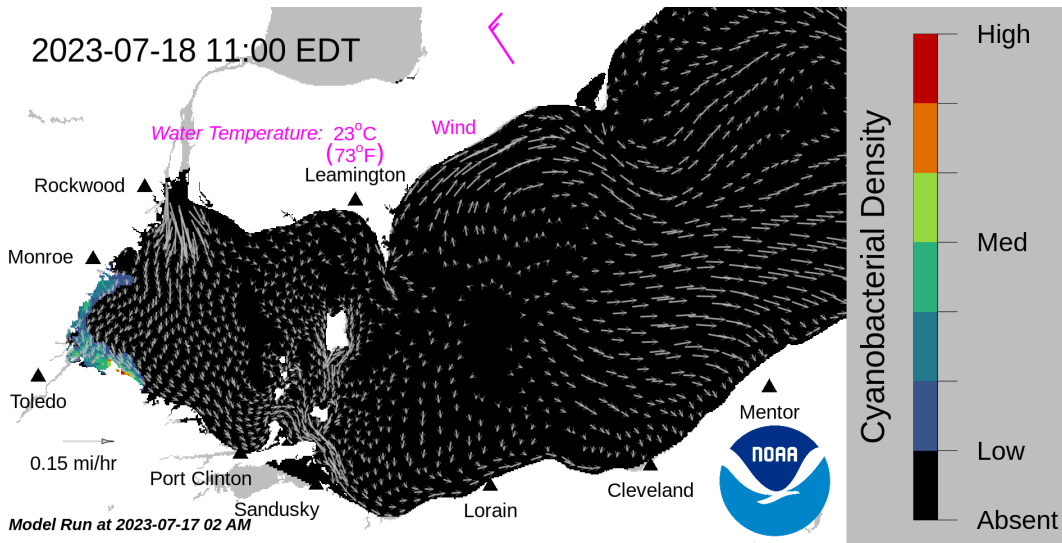

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Jul 14, 2023, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows a truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

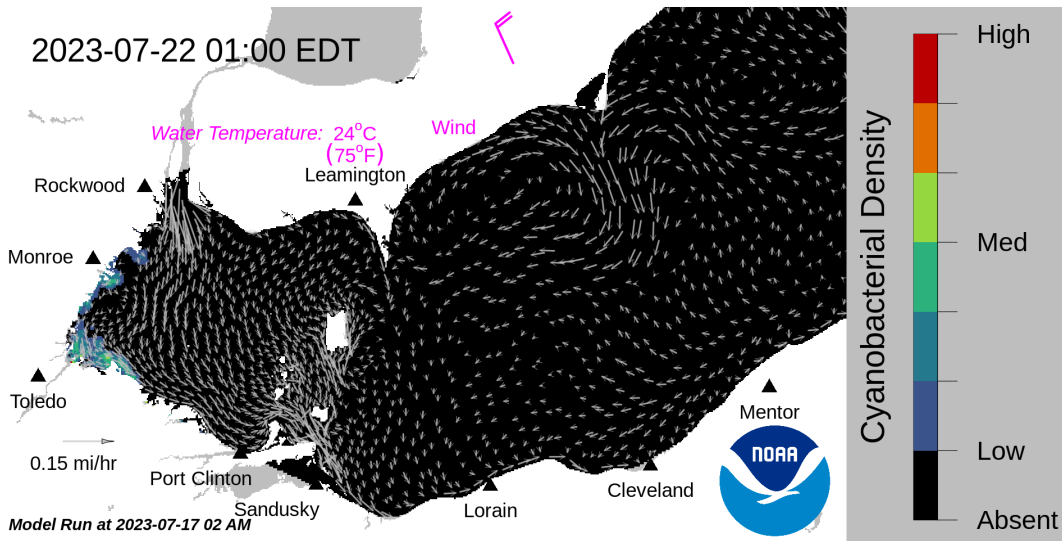

Wind speed and direction from ToledoCrib, OH. Blooms mix through water column at wind speeds > 15 knots.

Where the bloom is present in western Lake Erie, the potential risk of scum.

Forecast surface bloom position for Jul 18, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Jul 22. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
